

Business Question and Visualization Report

Date	28 June 2026
Team ID	Individual
Project Name	Food Ordering Behaviour and Consumer Trends: A Structured Analysis of Choices and Habits
Maximum Marks	5 Marks

Visualization development refers to the process of creating graphical representations of data to facilitate understanding, analysis, and decision-making. For this project — Food Ordering Behaviour and Consumer Trends — Tableau was used to transform 50,000 food ordering records across 19 attributes into interactive visual formats. The visualizations enable stakeholders to gain insights into customer preferences, city-wise performance, cuisine demand, revenue contribution, delivery patterns, and behavioural trends to support informed business decisions.

Business Questions and Visualisation

The following business questions were defined to guide the creation of meaningful and actionable visualizations in Tableau. Each question identifies a key metric from the food ordering dataset, specifies the appropriate chart type, and is supported by a screenshot of the actual Tableau visualization.

1. What are the overall key performance metrics of the food ordering platform?

- Visualization: Text Table (KPI Summary) showing Total Orders: 50,000 | Total Delivery Fee: ₹29,82,136 | Total Rating Points: 1,49,721 | Total Order Value: ₹2,73,86,555.

Screenshot of Visualisation:

The screenshot displays a Tableau interface with a 'key performance metrics' text table. The table contains four columns: 'Count of food_ordering_behavior_dataset.csv', 'Delivery Fee', 'Rating Given', and 'order_value'. The corresponding values are 50,000, ₹29,82,136, 1,49,721, and ₹2,73,86,555. The left sidebar shows the 'Columns' shelf with 'Measure Names' and the 'Rows' shelf with 'Measure Values'. The 'Measure Values' shelf lists four measures: 'CNT(food_ordering_behavior_dataset.csv)', 'SUM(Delivery Fee)', 'SUM(Rating Given)', and 'SUM(order_value)'.

key performance metrics			
Count of food_ordering_behavior_dataset.csv	Delivery Fee	Rating Given	order_value
50,000	₹29,82,136	1,49,721	₹2,73,86,555

2. How does cuisine demand vary across different cities?

- Visualization: Heatmap (Cuisine × City) using CNT(Order Id) with a red colour gradient. Mumbai–Biryani leads with 1,397 orders. Order counts range between 1,298–1,463 per city-cuisine cell, indicating near-uniform distribution.

Screenshot of Visualisation:

3. How are orders distributed across age groups and restaurant segments?

- Visualization: Stacked Bar Chart showing order count and order value by age group (Millennial, Gen Z, Adult, Child) segmented by Restaurant Type (Budget/Mid-range/Premium). Filtered by Meal Type and Day Type. Millennials and Gen Z lead with ~18K orders each.

Screenshot of Visualisation:

4. What is the distribution of customer cuisine preferences across all cities?

- Visualization: Pie Chart showing cuisine share. Desserts lead at 16.90%, Fast Food at 16.74%, Chinese at 16.70%, Biryani and South Indian at 16.60% each, North Indian at 16.46%. Near-uniform distribution across all 6 cuisines.

Screenshot of Visualisation:

5. How do orders vary across company type and meal type for different cities and cuisines?

- Visualization: Grouped Bar Chart with Company × Meal Type on columns and CNT(Order Id) on rows. Filtered by City and Cuisine. Family–Lunch peaks at 50,690 order value. Alone–Dinner leads in solo orders at 54,638.

Screenshot of Visualisation:

6. Which cities generate the highest order volumes?

- Visualization: Bar Chart with colour saturation comparing order count across 6 cities. Mumbai leads with 8,443 orders, followed by Pune (8,354), Bangalore (8,353), Delhi (8,309), Chandigarh (8,279), and Hyderabad (8,262).

Screenshot of Visualisation:

7. Which meal type contributes the most to total revenue?

- Visualization: Bar Chart showing SUM(order_value) by Meal Type. Breakfast leads at ₹69,24,753, followed by Snacks (₹68,60,530), Lunch (₹68,55,039), and Dinner (₹67,46,233). Filtered by City and Company.

Screenshot of Visualisation:

8. How does order placement time vary across cities for different restaurant types and meal types?

- Visualization: Bar Chart showing SUM(Time Taken To Order) by City with green colour gradient. Filtered by Restaurant Type (Premium) and Meal Type (Dinner). Hyderabad is fastest (5,006) and Bangalore is slowest (5,463).

Screenshot of Visualisation:

9. How do customer ratings compare across different meal types?

- Visualization: Donut Chart showing SUM(Rating Given) by Meal Type. Breakfast has the highest total rating (37,854), followed by Snacks (37,390), Lunch (37,175), and Dinner (37,084), indicating consistently moderate satisfaction across all meal types (avg ~2.99).
