

FOOD ORDERING BEHAVIOUR AND CONSUMER TRENDS

A Structured Analysis of Choices and Habits

Program	Data Analytics with Tableau
Project Type	Individual
Tools	Tableau Desktop / Tableau Public
Phase	Project Initialization & Planning
Date	25 June 2026

1. Define Problem Statement

The food delivery industry is becoming increasingly competitive, with businesses facing challenges in understanding customer behaviour, optimizing delivery performance, and maximizing revenue. Despite having large volumes of data, it is often difficult to identify key factors that influence order demand, customer spending patterns, and service efficiency. This creates a need for a structured analytical approach to transform raw data into actionable insights.

This project addresses the problem by analysing food ordering data using Tableau to uncover meaningful patterns and trends. The dataset includes key attributes such as Order ID, Order Value, Delivery Fee, Cuisine, Meal Type, City, and Time Taken for Delivery. By leveraging interactive visualizations, the project enables a deeper understanding of how different factors impact order volume, customer preferences, and operational performance.

Through this analysis, the project identifies critical insights such as top-performing cities, high-demand cuisines, peak meal times, and delivery time distribution. These findings help in recognizing areas of strong performance as well as opportunities for improvement.

| Core Business Question

How can data-driven BI insights from food ordering data empower businesses and stakeholders to make informed decisions about operational efficiency, customer preferences, pricing strategies, and delivery performance?

| Key Problem Dimensions

- Order value and delivery fee distribution across cities and cuisine types
- Identification of high-demand cuisines and preferred meal types
- City-wise performance analysis and growth corridors for food delivery
- Delivery time analysis to detect operational bottlenecks and efficiency gaps
- Trend analysis to detect shifts in customer ordering behaviour and preferences

2. Project Planning

Work Breakdown Structure (Epics)

Epic / Task	Description
Data Collection & Extraction	Gather food ordering dataset covering Order ID, Order Value, Delivery Fee, Cuisine, Meal Type, City, and Time Taken for Delivery
Data Preparation	Clean, normalize, and structure raw data; handle null values, duplicates, and type inconsistencies for Tableau readiness
Data Visualizations	Build individual charts — order value distributions, cuisine demand heatmaps, city comparisons, meal type and delivery time breakdowns
Dashboard	Assemble an interactive multi-view dashboard linking all visualizations with filters and cross-highlighting
Story	Create a Tableau Story with annotated narrative slides guiding stakeholders through key business insights and findings
Performance Testing	Validate dashboard load time, filter responsiveness, and cross-visualization accuracy
Web Integration	Publish to Tableau Public; integrate demo link and GitHub repository link into SkillWallet project card
Project Demonstration & Documentation	Record a walkthrough video, finalize README, and prepare presentation materials

Tools & Technology

- Tableau Desktop / Tableau Public — primary BI and visualization platform
- Microsoft Excel / CSV — dataset format for ingestion
- GitHub — version control and project documentation repository
- SkillWallet — project management and mentor review platform

3. Proposed Solution

The solution leverages Tableau's interactive BI capabilities to produce a data-driven platform that delivers targeted insights drawn from the food ordering dataset. The analysis focuses on uncovering patterns in customer behaviour, city-level performance, cuisine preferences, and delivery efficiency.

Insight-Specific Solutions

City & Geographic Analysis

Top-performing city identification, order volume maps, and city-wise revenue comparison to guide regional expansion and marketing decisions.

Cuisine & Meal Type Insights

High-demand cuisine rankings, meal type preference breakdowns, and peak ordering time analysis to support menu optimization and promotions.

Delivery Performance Analysis

Delivery time distribution charts, fee-to-value ratio analysis, and operational efficiency metrics to identify bottlenecks and service improvement opportunities.

Project Deliverables

Deliverable	Description
Interactive Dashboard	Multi-tab Tableau dashboard with filters covering order value, cuisine, city, meal type, and delivery time dimensions
Tableau Story	Annotated story arc walking through key findings on customer behaviour, city performance, and delivery efficiency with data-backed recommendations
GitHub Repository	Full project source including dataset, workbook (.twbx), and documentation README
Demo Recording	Walkthrough video demonstrating dashboard interactions and key insights for mentor evaluation

Success Criteria

- Dashboard clearly addresses all key analytical dimensions with dedicated filter views
- Order value, cuisine demand, city performance, and delivery insights are accurate and reproducible from the source dataset
- Story narrative is coherent and communicates actionable business recommendations
- Published Tableau Public workbook is accessible and loads within acceptable time
- GitHub repository is documented with README, dataset reference, and workbook file
